New research from CAMP, led by the University of Washington’s Dr. Deven Hamilton, takes a closer look at HIV in the Southern U.S. and what efforts are needed to reach the Ending the HIV Epidemic goals for reduced HIV incidence in the region.

Findings published in **PLOS One**¹ and **BMC Public Health**² dig into EHE efforts in the South, evaluating the impact of hypothetical improvements in ART as well as estimating the potential impact of expanding PrEP coverage among adults and adolescents — all with an eye toward achieving federal EHE goals.

**ART**: Antiretroviral therapy; **PLWH**: People Living with HIV; **MSM**: Men who Have Sex with Men; **PrEP**: Pre-Exposure Prophylaxis

Overall, uniform expansion of ART and PrEP across the entire population would lead to reductions in incidence — including significant reductions in HIV incidence among Non-Hispanic Black MSM and women reducing racial disparities.
